

Hydromax USA Identifies Potential Underground Water Pipeline Issues for Aurora Water in Colorado

PROJECT OVERVIEW

UTILITY:

Aurora Water partnering with CH2M

PIPELINE FOR ASSESSMENT:

- 30-inch steel water main installed in 1966 – on N Havana Street
- 27-inch steel water main installed in 1956 – on S Peoria Street

PIPELINE SPECIFICATION:

- **Wall thickness: 0.1875-inch** (in accordance with client's request and Ultrasonic Test results)
- **Cement mortar lining of 3/8-inch** (in accordance with client's request).

TECHNOLOGY USED:

p-CAT™ (pipe condition assessment technology)

p-CAT™ is a non-invasive and non-destructive technology suitable for pressurized metallic and asbestos cement pipelines and is applicable for potable water pipelines, raw water and waste water pipelines.

THE PROBLEM

Familiar with invasive condition assessment technologies in the market and the associated costs, CH2M and the Aurora Water set out to identifying a cost effective non-invasive pipe condition assessment tool that could be utilized to determine the health of their water infrastructure as well as identify potential problem locations.

After carefully researching available technologies on the market to include deployment methods, resulting data as well as pricing, CH2M and the Aurora Water selected Hydromax USA and p-CAT technology.

THE SOLUTION

p-CAT™ is a non-invasive pipeline condition assessment tool that utilizes inverse transient pressure wave analysis to determine pipe wall degradation and identify anomalies. Developed over 10 years ago by Dr. Young-il Kim from the University of Adelaide Australia. p-CAT is designed to test long stretches of pipe efficiently and effectively while giving the utility detailed analysis capable of change detection down to 30 ft. sub-sections. In addition to wall degradation, p-CAT identifies anomalies which may include, pockets of air, pipe material changes, blockages and valve closure.

CASE STUDY

ASSESSMENT PERFORMED

Working with CH2M and the Aurora Water, Hydromax USA collected all available data on the two pipelines including as-builts, GIS, pressure data, and repair history. Hydromax team performed a detailed analysis and feasibility review to ensure p-CAT was a proper fit for the proposed pipeline.

From that review it was determined the pipeline was an ideal candidate for p-CAT. Hydromax team then performed a site visit to locate, identify and inspect available assets needed for a successful deployment of p-CAT. Further review and final test planning were taken on at the completion of the successful site visit. Field Teams returned to Virginia Beach and successfully performed p-CAT testing on over 2 miles of pipe in 2 days' time using the existing air release valves and hydrants. Close boundary test was performed in this project.

Existing appurtenances like ARVs, hydrants etc. were used as both transient generation stations and measuring station.

The data was sent to the analysis team for detailed review and report generation. Utilizing pipeline specification provided by the Client, the analysis team performed a sub-sectional analysis to identify problem areas down to 30 ft. resolution.

Sample Visual Summary of Sub-Section Analysis Report

RESULTS

N HAVANA STREET | 30 INCH WATER MAIN:

- 32% of pipeline tested was **HIGHLY DETERIORATED**
- 4% of pipeline tested was in **MODERATE CONDITION**
- 64% of pipeline tested had 82–95% remaining wall thickness.
- 16 anomalies were identified including valves that were not fully sealed, pipe material change and entrapped air.

S PEORIA STREET | 27 INCH WATER MAIN:

- 44% of pipeline tested was **HIGHLY DETERIORATED**
- 35% of pipeline tested was in **MODERATE CONDITION**
- 20% of pipeline tested had 81–91% remaining wall thickness.
- 5 anomalies were identified including entrapped air and valve seal positions.

Section Number	Approx. Change (ft)		Sub-section Location on Pipeline	Assumed Pipe	Approx. Length (ft)	Theoretical Thickness (Inch)		Remaining Total Equivalent Wall Thickness (%) (Difference between total wall of tested section using the theoretical theoretical value)						Sub-Sectional Average Wave Speed (ft/s)
	Start	End				Wall	Lining	Assumed Internal Corrosion (%)			Assumed External Corrosion (%)			
								Wall (in)	Lining (in)	% remaining (%)	Wall (in)	Lining (in)	% remaining (%)
